Count data obtained from the American Fact Finder website (link on: <http://www.census.gov/acs/www/index.html>)

A Margin of Error (MOE) is provided in ACS tables instead of Standard Error. The MOE is the difference between an estimate and its upper or lower confidence bound in (Standard Error = Margin of Error / 1.645). Both confidence bounds and the standard error can easily be computed from the margin of error. All ACS published margin of error are based on a 90 percent confidence level.

Percent uninsured = number uninsured divided by number in age group; *percent uninsured MOE* was calculated using a formula from **2008 ACS Accuracy of the Data**, <http://www.census.gov/acs/www/Downloads/ACS/accuracy2008.pdf>.

The Office of Health Policy and Planning, Department of Health and Mental Hygiene, will assist persons needing help obtaining or interpreting ACS estimates for Maryland jurisdictions.
